The current drought has forced many companies to reduce production or accept risk on equipment due to water shortages or poor quality feed water.

PROXA has a range of AQUA MOBILE® water treatment units available for short-term rent to cover the dry season or until long term strategic plans can be put in place. Our systems are particularly well suited to upgrading low quality feed sources, including effluent streams for applications such as:

- Boiler feed
- Cooling tower make-up
- General wash water
- Process water

Available capacities vary from only a few cubic meters per hour to several 100m³/hr. Mobile units are available on a full rental basis, including operations, maintenance and technical support, countrywide or internationally. They can also be deployed fast.

In addition PROXA is able to assist in optimising water usage, water recovery and treatment for re-use. PROXA is committed to assisting clients in sustainably reducing their water footprint and costs.
